Abstract (en)
[origin: EP2204589A1] A clip is fixed on a fixing object by inserting a male part into an insertion ending position of a female part. The female part has a receiving space for the male part and includes a base portion provided with an insertion hole communicating with the receiving space and an inserted portion for a through hole provided in the fixing object. Thus, at least a portion of the inserted portion is deflected or an elastic engaging portion formed in the inserted portion is prevented from being deflected inwardly to thereby be fixed on the fixing object. In the base portion of the female part, a display body which moves forward by inserting the male part into the insertion ending position so as to enable to be visually confirmed at a forward movement ending position, is provided.
