Abstract (en)
[origin: WO2009059975A1] The invention relates to a sensor application (11) containing claimed modules consisting of a carrier strip (13) and a sensor strip (12). The sensor strip (12) is fixed to the carrier strip (13) which, in turn, is fixed, for example, to the back of a human proband. In this way, the spinal curvature can be determined, the carrier strip (13) and the sensor strip (12) being elastically embodied for this purpose. According to the invention, the carrier strip (13) comprises a data memory (22), for example an RFID label on which relevant information is stored. The data can be evaluated by an evaluation device (14), and the sensor strip (12) is only released when the carrier strip is suitable for the sensor strip used. In this way, defective functions and measuring errors are advantageously avoided. The invention also relates to a method for operating the sensor application.
