Abstract (en)

[origin: WO2009033610A1] The invention relates to a method for controlling and supplying power to at least one electrical consumer (5) that is connectable in a wired, electrically conductive fashion to an energy source. In said method, electrical energy is transferred by means of an alternating voltage and control information for activating the at least one electrical consumer (5) is transmitted to the electrical consumer (5) by means of an angle modulation of the alternating voltage used for the power supply. The control information is transmitted in binary form by means of a frequency modulation, wherein individual binary values (1) are depicted and transmitted by an associated predetermined frequency of the alternating voltage used for the power supply. Each binary value (1) is transmitted by a plurality of oscillations of the alternating voltage. The invention further relates to a system for controlling and supplying power to at least one electrical consumer (5) that is connectable in a wired, electrically conductive fashion to an energy source by means of a cable, said system comprising a device for generating an alternating voltage (9) that is disposed between the energy source and the at least one electrical consumer (5) and a device for the angle modulation of the alternating voltage, and the electrical consumer (5) comprising a decoder (17).
