Abstract (en)

[origin: EP2207243A1] The mechanism (10) has a plug device (42) provided in a casing (12), and a receiving chamber (60) provided in another casing (14). An electrical line connection is produced between the plug device and the receiving chamber in a nested condition of two casings independent of received or non-received signals of a supply air system. The casing (12) is designed with the plug device for a plug (62) connected with an exhaust system such that the plug is not pulled out from the receiving chamber or insertable into the receiving chamber in the nested condition of two casings.
