Abstract (en)

[origin: WO2009046561A2] The invention relates to a method and application technology for the residue-free disinfection of persons, pets, poultry barns and livestock sheds and other installations using ozone, electrolytically oxidative radicals, UV-C radiation, electrostatic spray technology, excess pressure ventilation and air-humidification technology. Preferably, the method contains the following steps: 1. Disinfection of humans, animals and objects by showering with electrolytically produced oxidative radicals in electrolytically produced oxidative water before entering the shed and in the sterile zones. (Fig. 2) 2. Disinfection of humans, animals and objects using ozone, electrolytically oxidative radicals, UV-C radiation, electrostatic spray technology, excess pressure ventilation and air-humidification technology in the sheds for the electrostatic spray disinfection of animals by means of a spray bar (fig. 1), for the disinfection of drinking water, for hoof and talon disinfection, for feed disinfection in silos and at feeding sites, for controlling flies and vermin, for regulating humidity and for air circulation, air purification and air sterilisation (fig. 3) and for preventing the entry of bacteria and pathogens through doors and windows during the transfer of the animals to the barn or shed. 3. Disinfection of humans, animals and objects using ozone, electrolytically oxidative radicals, UV-C radiation and electrostatic spray technology for disinfection before and after the transfer of the animals to the barn or shed, in order to prevent the transmission of infection and diseases as a quarantine measure.
