Abstract (en)
[origin: DE102009004975B3] The device has a control element arranged in a device housing and formed as a snapping disk made of metal. The housing is made of plastic or metal. The disk has an edge (1.4) that is connected with the housing in a firmly bonded manner. The edge forms a seal between the housing and the disk. An area of the disk is formed as a reversible and deformable decoupling area (1.3) that is conterminous with the edge. The decoupling area is circular and concentric, and is formed as an inclined surface. The disk has a preset diameter (d) and a switching stroke.
