Abstract (en)

[origin: WO2009062656A2] The invention relates to an apparatus (1) for removing liquids from a deformable container (10), with a connection (4) which can be connected to an opening (12) of the container (10) in order to conduct the liquid out of the container (10), with a conveying pipe (5), which is arranged downstream of the connection, in order to convey the liquid conducted out of the container (10), and with a deformation device (20), for deforming the container (10), which deformation device is designed in such a manner that the internal volume of the container (10) is reduced by action of the deformation device (20) on the container (10). According to the invention, the deformation device (20) has a deformation element (22) which is movable in relation to the container and can be brought into contact with the container (10), wherein the internal volume of the container (10) is reduced by the movement of said deformation element (22).
