Abstract (en)  
[origin: US2010294799A1] Disclosed is a dispensing device for dispensing liquid from a container having a top, a side wall and a bottom, comprising a sleeve which can be inserted into the top in a sealing manner and into which a rising pipe opens via an inflow opening, a piston which is movable in the sleeve and can be moved between a closed position, in which the inflow opening is closed off by the piston, and an opened position, in which the inflow opening is connected to an outlet opening via a cavity of the piston. The outlet opening opens into an outlet channel of an extension arm which protrudes laterally from the sleeve and the output of which is coupled to a dispensing valve which can be activated by means of an actuating member in order to allow, in the opened position, liquid to be dispensed. The extension arm with the dispensing valve is, in the closed position, completely recessed within an outwardly open recess between the top and an outer edge of the container and can be transferred by way of a movement of the piston into a dispensing position in which a dispensing opening protrudes outwards beyond the outer edge of the container.
