Abstract (en)  
[origin: EP2210527A1] A relaxation apparatus (10) includes a body-supporting unit (13) for supporting a user's body, a rocking unit (12) for rocking the body-supporting unit at least in one direction and a controller (24) for controlling the rocking unit to rock the body-supporting unit. The controller controls the rocking unit such that, at the end of the rocking motion of the body-supporting unit, a stop position of a seat portion of the body-supporting unit takes the lowest position during the rocking motion. Further, a cover member (14) is provided between a casing member surrounding the rocking unit and the body-supporting unit, which follows the rocking motion of the body-supporting unit relative to the rocking unit. The cover member is attached to both the casing member and the body-supporting unit to cover a gap between them. The cover member is installed tensely at the stop position of the seat portion of the body-supporting unit.
