Abstract (en)

[origin: EP2210979A2] The device (1) has a formwork holder (11) comprising a tilting bearing (20) to tilt the holder at a column element. An interior shield (13) is attached to the formwork holder, and an outer shield support (27) is supported at the formwork holder. The outer shield support is displaced to and fro in a direction opposite to the holder by an adjustment device (35), where the direction runs away from the interior shield. An outer shield is attached to the outer shield support. The tilting bearing lies below a longitudinal line of a switching element.
