Abstract (en)
[origin: EP2211009A2] The outwardly opening window assembly comprises four window sash profile members each comprising an outer element, a flange which extends at least partially opposite a peripheral edge of the window pane and means for attaching mounting hardware to the outer element, a thermally resistive element which is connected to said flange of said outer element, and an inner element which is connected to said thermally resistive element. The window assembly further comprises a re-enforcement fitting which is fastened to the outer element of one of the profile members and which extends in a direction towards the inside of the window assembly such that at least a portion of said fitting is located between at least a portion of the inner element which is connected to said thermally resistive element and a portion of a window frame. The re-enforcement fitting is in supporting contact with a portion of a locking mechanism.
