Abstract (en)
[origin: EP2211114A2] The method involves arranging program representations in form of a virtual token in an area in form of a virtual token board (200). Other program representations with parameters are automatically provided depending on parameters of the former program representations arranged in the area. The parameters are characterized for a function device of a cooking device, a treatment level, treatment gap, treatment line and/or treatment zone of the cooking device, a time point, time period, prioritization and climatic variables of programs corresponding to the program representations. An independent claim is also included for a cooking device comprising a function device for executing programs.
