Abstract (en)
[origin: WO2009070117A1] A fixing tool (5) for fastening of building framework members comprises a plate (6) attachable on a first framework member (1), the first transverse edge (4) of which plate has an abutment member (7) for the supporting of a second framework member (2) that is intended to be fastened on the first framework member (1). The plate (6) has fixing members (10, 12, 13) engageable in said first framework member (1) as well as a removal member (8) for the removal of the fixing tool (5) when said second framework member (2) is fastened to said first framework member (1). The invention also relates to a method where the fixing tool is used in the fastening of building framework members by the fact that the same is placed on a first framework member connecting to the intended position of a second framework member, and the fixing tool is fastened on said first framework member by the fact that the fixing members included in the fixing tool are driven into the surface of the first framework member, whereupon the second framework member resting against the abutment member of the fixing tool is fastened to said first framework member, whereupon the fixing tool is removed from said first framework member by applying a force to the removal member.
