Abstract (en)
[origin: FR2924264A1] The actuator (1) has coils (4) for moving a core (6) according to an alternate movement between a closing position and a nominal opening position of a valve (9). The core is moved beyond the opening position towards an end position. An elastic return element i.e. plug (11), of elastic material, returns the core towards the closing position, and is arranged to act on the core when the core is close to the end position. The core has a stop (12) to support the core, where the core is elastically deformable according to a direction parallel to the movement and is placed in contact with the stop.
