Abstract (en)

[origin: WO2009071833A2] The invention relates to a method for burning carbonated fuels, that uses a unit for separating gases from air, a combustion unit operating either with air or with an oxidant having a nitrogen content lower than air and at least partially produced by the unit for separating gases from air, and a compression and/or purification unit of the CO₂ resulting from the combustion fumes, characterised in that during a finite duration T, the power used by the unit for separating gases from the air is variable, and/or the capture of the CO₂ resulting from the combustion fumes via the CO₂ compression and/or purification unit, is variable.
