Abstract (en)
[origin: EP2216467A1] The container has circular segment elements comprising longitudinal grooves (6) for accommodating an injection product. The circular segment elements possess a pretensing wire (8) between front sides of the elements, where the wire is circulated by jacket tubes (7). One of the elements is formed as an anchoring element (3), where the jacket tubes and the pretensing wire are outwardly guided by a cross joint. The anchoring element comprises a grouting jacket tube besides the jacket tubes. The grouting tube connects the front sides together at a region of the grooves. An independent claim is also included for a method for manufacturing a large container.
