Abstract (en)  
[origin: EP2216485A2] The device (20) has a deflection part (30) held at a base part (22), and a deflection region (46) for receiving an end section of a cord (44). The deflection region is extended above 180 degree, and the end section is deflected in a longitudinal direction (26). A cord end support (36) detachably holds a free cord end of the end section that is deflected around 180 degree. The deflection part is displaced relative to the base part, and/or the cord end support holds the cord end at different positions relative to the base part. The positions are arranged along the direction.
