Abstract (en)

[origin: EP2216598A2] The method involves guiding a main fuel flow (10) and an additional fuel flow (7) for combustion in a combustion chamber (3). A fuel mixture with constant load is formed at a toxic raw material e.g. chlorine compound, and chlorine content is formed in exhaust gas during combustion. Adjustment of chlorine content is performed by control of supply of the additional fuel flow, based on chlorine content measurement by a sensor (12) in the exhaust gas. The additional fuel flow is supplied in the form of refuse.
