Abstract (en)
[origin: EP2216614A2] The device has an evaporation shell (12) and a condenser connected with each other such that waste heat of the condenser is partially supplied to condensation water provided in the shell. A receptacle (14) for the condenser is provided in or at the shell. The receptacle is arranged such that condensation water does not contact with the condenser. The receptacle comprises a wall that partially or completely surrounds a hollow space, which is designed such that the condenser is fixed in the hollow space in a form-fit and/or force-fit manner. The shell and shell form a module (10).
