Abstract (en)
To easily judge a transmission signal outputted from an own electronic device. A transmission part 7 outputs a transmission signal to a transmission path 1 side. Switching parts Q1 and Q2 are connected between a constant voltage power source and the transmission path 1, to switch on/off of a signal supplied from the constant voltage power source, being the transmission signal from the transmission part 7, and output it to the transmission path 1. A reception part 9 receives the transmission signal from the transmission path 1. A detection part 13 is connected between the constant voltage power source and the switching parts Q1, Q2, to detect the transmission signal from the transmission part 7 flowing through the switching parts Q1 and Q2. A selection part 15 selects the reception part 9, when the transmission signal from the transmission part 7 is not detected by the detection part 13.
