Abstract (en)
[origin: WO2009068141A1] The invention relates to a folding chair (10) comprising a frame (12) having two lateral bar elements (14) between which a seat part (16) can be moved about a folding axis (18), between a folded-up idle position and a folded-down seat position. A rotational connection device (20) defining the folding axis (18) is provided between each bar element (14) and the seat part (16). A bracket (22) protrudes forwards from each bar element (14), with the associated rotational connection device (20). At least two folding chairs (10) can be fixed adjacently to a cross bar (58) from which leg elements (60) project downwards.
