Abstract (en)  
[origin: WO2009068333A1] The invention relates to a driving rod drive (1) for a window or a door, wherein a pinion (10) is pivot-supported in a housing (4) that is composed of two housing halves (5, 6). The pinion (10) is made substantially of a disk-shaped part, the gearing (11) of which meshes with a gearing (20) of a driving rod (2) in a longitudinally displaceable manner. The pinion (10) is supported in a bearing (33) of the housing (4) by a bearing nose or collar (35), wherein the bearing nose or collar (35) is attached on an integrated part (25) that is connected to the disk-shaped part. In order to provide a driving rod drive (1) that has a closed construction and can be produced in an easy and cost-effective manner, the invention proposes that a filler piece (7, 8) be attached between the housing halves (5, 6), which is connected as one piece to the integrated part (25) via connecting bars (26) that are shearable upon activation of the driving rod drive (1).
