Abstract (en)
The present display refrigerator with a multi-tray radial arrangement having a radial arrangement from which a number of trays detach, depending on the requirements of the seller. The trays are shaped as circle sectors defined by two radii and the arc formed between both, and are fastened to a central shaft on which they slide to modify the height thereof depending on the size of the product to be stored on said tray. In this way, maximum use is made of the internal volume of the refrigerator, with each tray set at a different level depending on the product to be displayed therein. Also, the radial arrangement is connected to a rotating mechanism which causes homogenous cooling for all products displayed in the refrigerator. Ergonomically, the refrigerator provides a marked competitive advantage since the external design thereof affords more display in less physical space.
