Abstract (en)

[origin: EP2218673A1] The device has a deployable lateral arm (1) articulated on a shell (4) of a vehicle between a folded position and a deployed position in which a support end (3) of the arm is in contact on horizontal plane ground (2). A motor actuator (6) is mounted between the shell and the arm. The arm is formed by rectilinear sections forming an angle between each other. The support end is supported on a horizontal plane ground on which a vehicle (12), intervening an arms pivoting angle, is positioned, where the angle is lesser than or equal to 90 degrees.
