Abstract (en)  
[origin: EP2218851A2] The mechanism (1) has a locking unit (5) with a locking projection for a door facade (2), where the projection rearwardly extends in an opposite direction. The projection locks an engagement section (6) in a locking position (Pv) against deviation in an unlocking position. The section is movable from the locking position to an intermediate position against pressurization force in a direction of a rotational axis (4) so that the section turns a working region of the projection, and a lever (3) is pivotable at the projection from the intermediate position to the unlocking position.
