Abstract (en)
[origin: EP2218989A2] The device has a door (4) hinged at outer wall (1) and a frame (2), and a damper arranged between door-side and body side contact points. The damper is expandable for damping a closing movement of the door. The damper is engaged at a front side (2a) of the receiver formed at the outer wall and the frame. The receiver is formed as an elongated depression or hole-like sleeve body, and accessible from a front side of the outer wall and the frame, where freedom of movement of the damper is smaller than that of the contact points. A multiple-joint hinge (3) connects the door with a body.
