Abstract (en)
[origin: WO2009065697A1] The present invention relates to an extractor hood (1) for discharging an airflow from a room, having a housing (2), at least one fan (3) for conveying the airflow through the extractor hood (1), sorption means (5) of a sorption unit (4) arranged in the airflow for absorbing moisture present in the airflow, and an identification device (6) for identifying the saturation level of the sorption means (5). The extractor hood (1) is characterized in that the identification device (6) has a detection unit (61) with at least one temperature-measuring point (612), which is arranged in the sorption means (5) in the sorption unit (4) and detects the temperature in at least one area of the sorption means (5) in the sorption unit (4). A method for operating such an extractor hood (1) is also described.
