Abstract (en)  
[origin: EP2221435A2] The device has a closing mechanism actuated by a supplementary-window handle (8) and including closing bolts, which are pushed in and pulled out along a feeding axis (10) for engagement with a supplementary-closing plate (6). Identical connections are provided on sides of the closing mechanism for drivingly coupling the closing mechanism. An assembly configuration of the device is changed by rotating the closing mechanism relative to the device around a transverse axis (18). The transverse axis runs parallel to the feeding axis and through an actuating shaft axis.
