Abstract (en)
[origin: US2010299853A1] The invention relates to a cleaning apparatus, in particular a high-pressure cleaning apparatus, on which at least one fastening device for fastening the cleaning apparatus to a carrier is disposed, with the at least one fastening device comprising at least one tensioning section on which a tensile force, which is directed at the carrier, acts when the cleaning apparatus is fastened to the carrier by means of a tensioning element, and also comprising at least one retaining section, which is connected to the at least one tensioning section, for retaining the at least one fastening device on the cleaning apparatus. In order to develop a cleaning apparatus of this type such that the risk of damage to the cleaning apparatus by an excessive tensile force can be reduced, the invention proposes that the at least one fastening device has at least one support section in order to be supported on the cleaning apparatus, said support section being connected to the at least one tensioning section by means of at least one connecting section, with the at least one connecting section yielding if the tensile force exceeds a maximum permissible tensile force.
