Abstract (en)

[origin: WO2009077435A2] The present invention relates to a device (1) for determining and/or monitoring at least one fill level (F, F0, Fu) of at least one medium (2, 3) in a tank (4) using a run-time measurement method and/or a capacitive measurement method by means of a at least one measurement probe (4) comprised by device (1), a capacitive measurement circuit (8), a time-range reflectometer measurement circuit (7), and a control/evaluation unit (6). According to the invention, a crossover network carries the low-frequency measurement signal (SNF) and the high-frequency, electromagnetic measurement signal (SHF) to the measurement probe (5) and causes a technical signal separation of the high-frequency, electromagnetic measurement signal (SHF) into the first signal path (17) of the time-range reflectometer measurement circuit (7) and the low-frequency measurement signal (SNp) into the second signal path (18) of the capacitive measurement circuit (8).
