Abstract (en)
[origin: US2009151426A1] Methods and related systems are described for high pressure chromatographic analysis. The described system includes a flowpath adapted to flow a mobile phase and the sample at high pressures, an injector adapted to inject the fluid sample into a flowpath, a separation column adapted to operate at high pressures for separating various components, a detector and a processor that calculates the amount of at least one component of the fluid sample. The system can operate at pressures above 20 atm or even 100 atm, and temperatures above about 100 degrees Celsius. The system can be deployed in a wellbore in a subterranean rock formation, and include a fluid collection system for obtaining the fluid sample downhole. The system can also be located close to a wellhead and includes a tap in fluid communication with a surface flowline carrying produced fluids and the injector.
