Abstract (en)
[origin: WO2009077004A1] The present invention relates to a connector for connecting at least one output device (3) to a rendering device (2). The connector is characterized in that the connector (5) comprises at least one interruption unit (54) for managing the connection of the output device (3) to the rendering device (2), at least one detection unit (53) for detecting at least one external signal and at least one adjustment unit (56) for adjusting the detection unit (53). The invention further relates to a method for managing the connection from a rendering device (2) to at least one output device (3) with a connector (5) interposed between the rendering device (2) comprising at least one detection unit (53) for detecting external signals and an adjustment unit (56) for adjusting the detection unit (53), and the output device (3). The method is characterized in that upon detection of at least one external signal detected according to settings of the adjustment unit (56) at the connector (5) the transmission of signals from the rendering device (2) to the output device (3) is being altered and a preset audio signal is put into the connection by means (55) for inputting a preset audio signal.
