Abstract (en)
[origin: EP2224091A2] The bearing has a rotary body rotatably mounted in a bearing housing and including a hollow shaft, which is fixedly connected with a drive shaft of a blind. A rocker is pivotably mounted in the housing around a pivot angle. A pivot coupling couples the rocker with the rotary body. An exchangeable stop part (13) with stop units (15, 17) is arranged in the housing. The stop units decouple the rocker from the rotary body. One of the stop units is exchanged or varied in a position for allowing different pivot positions of the rocker. The housing includes an aperture in a region of the stop part.
