Abstract (en)

[origin: WO2009083233A1] A device (70) for evacuating people from a building is provided with a rescue member via which people can be brought from an upper story of the building (2) to a ground area (28). The rescue member has at least one rope (20), strip or the like let down from the upper story of the building (2) along the building wall to the ground area (28). Arranged on this rope (20) at specific intervals are support bodies (31), to which in each case a support element (32), on which at least one person is held, can be attached in the respective story. The support elements (32) can be detached automatically from the support bodies (31) affixed to the rope (20) in an area near the ground area (28). This device (70) enables safe, trouble-free evacuation of people.
