Abstract (en)

[origin: WO2009071304A1] The invention relates to a container for accommodating coins and/or valuable documents, comprising a container housing having at least one feed opening for feeding coins or valuable documents into the container housing, a locking element that can be moved back and forth between a locking position in which the locking element blocks the feed opening, and an open position in which the feed opening is released and feeding of coins or valuable documents is enabled, a pretensioning element that pretensions the locking element at least in the region of the open position in the direction of the locking position, an actuating opening through which a predetermined actuating element may engage into the container and move the locking element from the locking position into the open position in the direction of the container upon a motion, a latching device comprising a latching element that can be moved back and forth between a standby position and a latching position, which in the standby position maintains the latching element in the latching position, and which can be moved back and forth between a standby state in which the latching element is forced away from the latching position into the standby position, and an a latched state in which the latching element is forced toward the latching position, and a locking device by means of which the latching device can be moved from the latching state into the standby state, wherein the latching device and the locking element are coupled such that the latching device is moved from the standby state into the latching state by a movement of the locking element from the latching position into the open position of the latching device.
