Abstract (en)

[origin: WO2009083116A1] The invention relates to a signal processing device having a first signal processing component (101), a second signal processing component (103), a third signal processing component (105), and a safety component (107), wherein the first signal processing component (101) and the second signal processing component (103) can be operated in parallel for providing signal processing redundancy, and are designed to output an output signal when actuated by an input signal, and wherein the safety component (107) is designed to replace the first signal processing component (101) or the second signal processing component (103) with the third signal processing component (105).
