Abstract (en)

[origin: EP2228177A1] The device (2) has a hydraulic motor (19) comprising a readjusting device that moves back to a starting position after opening of a pressure relief valve and transports hydraulic fluid from the hydraulic motor in to a hydraulic reservoir (14). An actual value sensor detects a physical value, which correlates with a pressing resistance. An actual value sensor detects a speed of a drive motor (4), and a control device disconnects the drive motor when an evaluation device determines increase of speed of the drive motor after opening of the pressure relief valve. An independent claim is also included for a pressing device comprising a pressing tool.
