Abstract (en)
[origin: EP2230462A2] The method involves switching off a gas burner (16) and/or closing a corresponding gas valve (17) using a pan detection unit, when a pan (22) is detected initially at a cooking point (14) and detected as removed at the cooking point. The re-placing of pan onto the point is detected by the detection unit. The operation of the gas burner is renewed by igniting the gas burner after opening of gas valve. The gas burner is ignited after the pan is again placed on the cooking point, where power level originally set for the gas burner only takes place to a full extent with a delay. An independent claim is also included for a device for executing a method for operating a cooking point, comprising a gas burner.
