Abstract (en)

[origin: WO2009074258A1] The invention relates to a joint hinge (1), particularly for glass swinging doors, having a stationary hinge part, a leaf hinge part (2) pivoting about the stationary hinge part, a pivoting axis engaging through the stationary hinge part and the leaf hinge part (2), a cam (7a) having at least one recess (7b) being disposed on said axis, and a roller (22) to which a force is applied and which interacts with the cam (7). In order to obtain an accurate adjustability of the neutral position of the door, the invention provides that the roller (22) is adjustably disposed orthogonal to the longitudinal axis of the joint hinge (X-X).
