Abstract (en)  
[origin: EP2233668A1] A lock accessory, whereby a key-operated lock is convertible into an electrically operated lock. The lock comprises a rotatable opening spindle (4) and a turn spindle (3) rotatable with a handle element (3a). The accessory comprises a housing mountable on a door surface, into which said spindles (3,4) extend and which contains a mechanism (40,41) interconnecting the spindles (3,4) and being capable of coupling, by way of an electrical control (10,11,12), the spindles (3, 4) with each other for a relative mechanical drive link engagement, such that a rotation of the opening spindle (4) translates into a rotational motion of the turn spindle (3) as well. The mechanism (40,41) for the drive link engagement is adapted to decouple either automatically after a delay time or as the lock is opened. The opening spindle (4) is in its rotation-effecting engagement with an opening ring (5), which is rotatable manually from outside the door (1) and which encircles a key cylinder (2) or a key cylinder extension (2).
