Abstract (en)

[origin: EP2233732A1] The device has a starter drive assembly for starting a combustion engine through a toothed crown wheel. An electrical motor rotatably drives the drive assembly. The motor has a stator (3) comprising an inductor winding (5) formed by a set of coils, where one of the coils presents low electrical resistance and another coil presents high electrical resistance. A set of contactors (55) of the motor controls power supply of a portion of shunt coils (51, 52) before controlling the power supply of all coils of the inductor winding. An independent claim is also included for a method for starting a combustion engine of a motor vehicle.
