Abstract (en)
The present invention relates to the field of cooling technologies and, particularly, discloses a heat source cooling method, a cooling air channel (4) and a projector capable of ensuring desired normal operating temperatures of a heat source (5). The heat source cooling method comprises the steps of: blowing (101) a cooling air flow towards a heat source (5); and splitting (102) the cooling air flow into a first split air flow and a second split air flow, wherein the first split air flow is blowing towards and directly cooling a first portion of the heat source, the second split air flow is blowing towards and directly cooling a second portion of the heat source, and other portions of the heat source (5) are being cooled indirectly by heat conduction via the first portion and/or the second portion. The present invention is adapted to cool the heat source (5).
