Abstract (en)
[origin: EP2234000A2] The device (1) has a concealed operating handle moved automatically between a countersink position and a drive position by motors (24, 26). A coupling device is coupled with the operating handle for controlling motion of the operating handle on straight racks (27, 28). The straight racks are arranged parallel to a longitudinal axis (A) of the operating handle. The straight racks are formed on an outer side of a carrier element (13). The carrier element includes a grab handle (12) and rotatably adjusts operating conditions of the operating handle.
