Abstract (en)

[origin: US8479657B2] In order to facilitate entering or exiting in a cable railway system, at least one part of the floor of the passenger region adjoining the passenger gondolas is formed by a transport device, which is configured to transport the passengers located thereon in the direction of movement of the passenger gondolas. The transport device can be formed by one or more conveyor belts, which follow the path of the passenger gondolas for a distance such that the passenger can comfortably change over from the transport device to the gondolas.
