Abstract (en)

[origin: WO2008141838A2] The invention relates to a method for conducting a rapid and secure short application of a user to a computer-supported service portal, the services of which such as, for example, processing non-cash payment transactions or downloading certain data, may be accessed via a mobile communications device. The invention provides for a user identifier (40) to be available on the user's side. Said user identifier may be present, for example, in the form of a biometric characteristic of the user (60) or be stored in an identification device (10) that exchanges the user identifier (40) via a close-range communication path (50) with a user-side communication device (20), from which the identifier is transmitted for application to a computer-controlled service portal supplied via a service provider device (30), such that it is no longer necessary for a user name or personal password to be entered for the user.
