Abstract (en)

[origin: EP2236719A2] The device has a clutch (5) interconnected between a motor i.e. electric motor, and a motor vehicle-closing device (1), and transferred in a complete or partially releasing condition for manual pressurization of the motor vehicle-closing device by an operator. The releasing condition is engaged based on requirement of an operator condition, where an operator request is transferred to the clutch by mechanical lever chains (2, 9, 10) for providing the releasing condition, and is registered by information retrieval of a sensor (11). An independent claim is also included for a method for actuating a motor vehicle-closing device i.e. motor vehicle side door.
