Abstract (en)

[origin: EP2237290A1] The method involves pressing a compressible supporting material into a rigid frame to form preassembled units, where side limb length (a) of the supporting material corresponds to the defined desired distance between a core (2) and a coil (3), and side limb length of the frame is less than the side limb length of the supporting material. The preassembled units are introduced between the core and the coil. The rigid frame is removed from the supporting material, and supports (10-13) are formed between the core and the coil.
