Abstract (en)

[origin: WO2009095329A2] A refrigeration device (KG) has a first component (TW), which is thermally sealed relative to a second component (TR) using an elongated seal element (DE) in the form of a hollow profile. To this end, the seal element (DE) in the form of a hollow profile comprises an elongated materially-rigid seal base (HKD) and an elongated materially-elastic seal head (WKD) attached thereon. At least one open end of the seal element (DE) in the form of a hollow profile is closed by a terminus element (AE1), which also has a materially-rigid seal base (HKA) and a materially-elastic seal head (HKA) attached thereon. The materially-rigid seal bases of the terminus element (AE1) and the seal element (DE) are connected to one another.
