Abstract (en)  
A maintenance support device comprises: a determining unit that determines whether a maintenance work has been performed based on presence of a second work, which is different from the maintenance work and is performed at a time of performing the maintenance work for maintaining a printing press; and a display controller that causes to display information prompting to perform the maintenance work, when a predetermined period has passed since a last determination that the maintenance work has been performed until a next determination that the maintenance work has been performed again. Accordingly, because information indicating that the first work has been performed is automatically input to the maintenance support device, the maintenance support device can display more accurate information relating to maintenance to an operator.
