Abstract (en)

A replacement and urging device for the bucket teeth of an engineering construction machine is disclosed. An adaptor (1) is mounted with a bucket tooth (5). A first through hole (121) goes horizontally through the adaptor (1). Both sides of the bucket tooth (5) are formed with a second through hole (52), respectively. An engaging unit (7) is interposed between the first through hole (121) and the second through holes (52) to slide between them. This enables the bucket teeth (5) to be mounted and positioned on the adaptor (1). The invention thus prevents the bucket tooth (5) from constantly hitting the adaptor (1).
